Table S5. Os-isotope LA MC-ICP-MS data and calculated $\gamma^{187}Os(T)$ values of PGM from placer deposits of the Guli massif

*PGM abbreviations: Os – native osmium, (Os,Ir) – Ir-bearing osmium, Lr – laurite, As-Erl – As-bearing erlichmanite. The initial ¹⁸⁷Os/¹⁸⁸Os and γ ¹⁸⁷Os(T) values were calculated for the time of formation of the Os-rich alloys at 250 Ma using the parameters specified in the text. The uncertainty on the measured ¹⁸⁷Re/¹⁸⁸Os and ¹⁸⁷Os/¹⁸⁸Os is 2SE of the mean in the last decimal place; SD – standard deviation.

Note. Sample G-40 – chromitite, samples 67 and 7-71 – native osmium ($O_{887}Ir_8Ru_5$ and $O_{894}Ir_3Ru_3$, respectively). The uncertainties on the isotopic ratios and the initial Os isotopic composition are quoted at 2SD based on the long-term reproducibility of the Johnson-Matthey Os standard at IGL [Puchtel et al., 2020]. The initial $\mu^{186}O_8(T)$ and $\gamma^{187}O_8(T)$ values were calculated for the time of formation of chromitite and native osmium at 250 Ma using the parameters specified in the text. The uncertainty on the measured ¹⁸⁷Re/¹⁸⁸Os, ¹⁸⁷Os/¹⁸⁸Os, ¹⁹⁰Pt/¹⁸⁸Os, ¹⁸⁶Os/¹⁸⁸Os is 2SE of the mean in the last decimal place.
